<p>The composition of the dried solid liposome comprises (wt%) lipid (10-60), cholesterol (4-40) and skeleton material (25- 85). Its preparation process includes the following steps: dispersing lipid and cholesterol in the water containing skeleton material, low-temperature treatment, freeze-drying and sealing to obtain the invented product. The liposome can be mixed with the encapsulated medicine only when it is used, so that it does not affect the medicine, and is specially applicable for encapsulating easily-sensitive medicines of biological-active medicine, etc., and is convenient for storage and transportation.
